EDUCATION

Vellore Institute of Technology (VIT) **2016 – 2020**

Bachelor of Technology in Computer Science and Engineering **Vellore, TN**

Indian Institute of Technology (IIT) Madras **2023 – 2025**

Master of Technology (MTech) in Data Science and AI **Chennai, TN**

SKILLS

Language: Java, Python, JS; **Data**: SQL
Web UI: Selenium/Cucumber BDD, Playwright, Cypress
API: REST Assured, Postman CLI; **Schemas:** OpenAPI/Swagger
Mobile: Appium; emulators & real devices
Performance: JMeter
CI/CD: Git, Jenkins, Kubernetes
Ephemeral Env: Docker ; **Distributed Execution:** Selenium Grid
Observability & **Collab:** Confluence, TestRail, Kibana, Jira

SUMMARY

- QA Automation Engineer with **2 years 3 months** experience in Web (Selenium + Cucumber BDD), iOS (Appium), API (REST Assured) and Performance (JMeter) plus Manual QA—test planning & case design, exploratory/UAT, smoke/regression, defect triage, SQL data checks; delivered **25%** regression speed-up and **85%+** automated coverage in Restaurant Tech - Lavu iPad POS & Menu Drive online ordering platform.

EXPERIENCE

QA Automation Engineer **2021 – 2023**
Lavu POS, USA **Hyderabad, TS**

Menu Drive (Online Ordering, US; integrates with Lavu POS) - Web Automation (Cucumber BDD) & Perf. Testing (JMeter)

- Spearheaded complete refactoring of legacy Cucumber BDD framework resulting in 25% faster test execution for full regression suite and 10% improvement in test maintainability across 300+ automated test cases. Boosted automated regression test coverage from ~30% to 85%, reducing manual testing effort by 60%.
- Established performance baseline and conducted stress testing for user registration workflow using JMeter uncovering database connection pool exhaustion issue that would have caused system failure at scale, preventing estimated $2M in potential revenue loss during high-traffic restaurant operational hours
- Led test planning for Menu Drive's releases, defined test strategies covering UI, API (Postman) & Performance Testing. Developed comprehensive test plans and risk-based test suites aligned with restaurant peak hours and menu update scenarios, which improved test coverage to 95% of requirements**.**

Lavu iPad POS (iOS App; Restaurants/Cafés/Bars) – iOS Automation (Appium) & API Automation (Rest Assured)

- Led a team of 3 engineers to build mobile automation framework (iOS/Appium) from ground up, with 250+ automated test cases covering 90% critical user flows, integrated with REST Assured API layer for end-to-end validation across mobile and backend services
- Developed and maintained library of 150+ complex SQL queries to validate data integrity catching 40+ critical data inconsistencies in order processing, payment transactions, and inventory sync before production deployments
- Implemented comprehensive API test suite covering 120+ RESTful endpoints using Postman/REST Assured, validating OAuth 2.0/JWT authentication flows, JSON schema compliance, discovering 18 critical security vulnerabilities and 35 functional defects before production releases
- Collaborated with development, product, and DevOps teams, leading defect triage sessions that reduced average bug resolution time by 30%, performed root cause analysis on 40+ production incidents
- Conducted in-depth manual functional testing for all Lavu POS features, mimicking real restaurant workflows. Created exploratory test charters for complex order scenarios, identifying major usability issues **(**e.g. order routing errors, tax miscalculations) that automated tests overlooked, and ensuring a smoother release
- Leveraged deep restaurant POS/domain knowledge of Lavu POS to design realistic end-to-end test scenarios (e.g. kitchen display integrations, online orders syncing to POS, reporting). This domain-focused testing approach prevented at least 10 production issues related to real-world use cases
